A Deviations from the pre-analysis plan

After the pre-analysis plan was filed, the survey was shortened in order to make sure respondents were paying attention throughout its duration. Several questions on the following topics were cut:

- Expenditure on education

- Psychological well-being

- Belief in market values

- The expenditures for which borrowing occurred

As a result, I am unable to report effects on these outcomes.

Also, I had planned on a) using a split-sample strategy to select hypotheses for testing as recommended by Anderson and Magruder 2017 and Olken 2015 and b) reporting effects for indices of outcomes. I had intended to take these steps to reduce the number of hypotheses tested and therefore decrease the number of multiple-testing adjustments required. Instead, I tested all of the hypotheses reported in the pre-analysis plan and made multiple-testing adjustments within families of hypotheses; this choice should lead to more conservative p-values.

I also do not report heterogeneous effects on income group, lottery year, and whether the lottery building is in the same ward as the original home due to insufficient power to detect these effects.

B Variable definitions for survey outcomes

Table SI.1: Variable definitions.

Label	Survey Question	Response options	Coding
Years of education	How many years of schooling have you completed?	Integer	Integer
Working	How many days did you work in the past week?	Integer	Working: I(x>0); Full-time:I(x≥5); Part-time:(5≥x>0)
Schools	Are any of your [sons/daughters] enrolled in the following types of schools (select multiple):	Public, English medium, Religious, N/A	Public:I(x=Public); English-medium: I(x=English-medium)
After-school tuition	Are any of your [sons/daughters] enrolled in after-school tuition?	Yes, No, N/A	I(x=Yes)
Main earner salaried	Which of these categories best describes your/the households highest earners principal paid activity?	Salaried worker, Wage worker, N/A	I(x=Salaried worker)
Main earner govt. job	Is your position with the following:	Government, Private sector, N/A	I(x=Government)
Main earner formal sector job	Did you receive any of the following upon being hired:	Letter, Contract, Pension information, N/A	I(x=Letter|Contract|Pension)
Makeshift floor	For enumerator: Is the respondent's floor:	Permanent, Makeshift	I(x=Makeshift)
Makeshift roof	For enumerator: Is the respondent's roof:	Permanent, Semi-permanent, Makeshift	I(x=Makeshift)
Private tap	Is your water source shared?	Yes, No	I(x=No)
Private toilet	Is your toilet shared?	Yes, No	I (x=No)
Happy w/ financial situation	How happy are you with the financial situation of your household?	Happy, Neither happy nor unhappy, Unhappy	I(x=Happy)
Children will have better lives	Do you expect your children to have better lives than you?	Yes, No, Don't Know	I(x=Yes)
Leaving Mumbai in the future	Do you think you will leave Mumbai in the future?	Would never leave, Might leave in future, Will definitely leave	Would never leave:I(x=Would never leave); Unsure:I(x=Might leave)
Trusts others	Would you say that one can trust other people or that people cannot be trusted?	Yes, No, Don't know	I(x=Yes)
Thinks effort leads to greater success	Do you think people who put in effort have more success than those who don't?	More, Less, Don't know	I(x=More)
Claims to make own decisions	When make an important life decision (e.g. about your career, marriage, childrens education), how do you make your choices?	Traditional values guide me, My family's input guides me, Input from the neighborhood guides me, I make my own choices without input from others	I(x=I make my own choices)
N Illnesses in the last month	In the past month, how many times have members of your household fallen ill?	Integer	Integer
Doctor type	What type of doctor does your family see?	Bengali/ ayurvedic/ homeopathic doctor, Medically certified doctor, Non-certified family member, Unsure/None	Homeopathic: I(x=Bengali/ ayurvedic/ homeopathic); Medically certified: I(x=Medically certified); Family: I(x=Non-certified family); Unsure/None: I(x=Unsure/None)

C   Additional lottery information

Figure SI.1: Location of the addresses of households in the sample (small pink dots) along with the location of apartment buildings (large blue dots) at the time of application
Table SI.2: Lotteries included in the sample

Lottery ID	N winners	Year	Group	Neighborhood	Area[1]	Allotment price[2]	Current price[3]	Downpayment[4]
274	14	2012	LIG	Charkop	402	2,725,211	5,000,000	15,050
275	14	2012	LIG	Charkop	462	3,130,985	6,000,000	15,050
276	14	2012	LIG	Charkop	403	2,731,441	5,000,000	15,050
283	270	2012	LIG	Malvani	306	1,936,700	2,800,000	15,050
284	130	2012	LIG	Vinobha Bhave Nagar	269	1,500,000	2,700,000	15,050

Table SI.3: Caste/occupation category codes

Code	Category
AR	Artist
CG	Central govt. servant occupying staff qrts.
DF	Families of defense personall
DT	Denotified tripes
EX	Ex-servicemen and dependents
FF	Freedom fighters
GP	General public
JR	Journalists
ME	MHADA employees
MP/MLA/MLC	Ex-members of parliament, legislative assemblies, legislative councils
NT	Nomadic tribes
PH	Handicapped persons
SC	Scheduled castes
SG	State government employees who have retired
ST	Scheduled tribes

D Effects on income, assets, and borrowing

Respondents were generally unable to provide numbers for monthly earnings, but preferred to provide ranges instead. Enumerators thus placed respondents into income bins. The bins used, unfortunately, appear to not capture the full range of the income distribution but rather only the left tail. Even so, a rightward shift in the distribution shows that winners clearly are earning more than non-winners. The p-value for a KS-test comparing these two distributions is 0.001.

Figure SI.2: The reported income distribution for winners and non-winners. Bars represent the frequency of households in each income bin
Winning households do not appear to be consuming more durable assets than non-winning households (Table SI.4). They do not appear more likely to own common components of many asset-based indices of wealth, such as computers and dining tables, even while control group ownership of these items is not particularly high.

I also asked individuals a multiple choice question about the sources to which they would turn when faced with a shock such as a family illness. Winners are about 5 percentage points more likely to report turning to commercial banks or credit unions, but the effect is no longer statistically significant after correcting for multiple hypothesis testing.

Table SI.4: Treatment effects on asset ownership and reported likelihood of visiting commercial banks for loans.

Variable[1]	Control[2]	Treatment[3]	s.e.[4]	Adjusted p[5]
A: Asset ownership				
Stand-alone closet	0.710	-0.098	0.049	0.210

Total	**500**	**500**	-

Once mapped, I place households into state and municipal electoral wards to test for evidence of selection into the mapped treatment group by electoral ward. Selection by ward would indicate that individuals from certain locations or with certain political representatives are more likely than others to win the lottery. Here, I estimate regressions of the treatment indicator on the state and municipal ward membership indicators and calculate a

Table SI.8: Regression of treatment indicator on the covariates

| Covariates[1]	Winning the housing lottery
OBC	−0.053
	(0.057)
SCST	0.060
	(0.071)

	(0.124)
From Mumbai	−0.003
	(0.047)
From the same ward as the apartment building	0.051
	(0.061)
Block dummies?	Yes
F Statistic (df = 91; 742)	1.2046
N	834
R^2	0.120
Adjusted R^2	0.015

[1] Unless otherwise specified, all covariates are dummy variables.   [2] "*Kutcha*" means "raw" or "impermanent." Variable measured at time of application through recall.

heteroscedasticity-robust Wald statistic for the hypothesis that the coefficients on all of the indicators (other than stratum randomization dummies) are zero. The p-values for regressions on state and municipal ward membership are 0.35 and 0.46, respectively.

I also conduct balance tests *within* each of Mumbai's municipal wards. The indicator for being from the same ward as the one in which the lottery is held is removed here. One ward (A) is dropped due to low sample size. Figure SI.3 presents the distribution of the 24 estimated treatment effects along with the estimated 24 p-values. Consistent with the null hypothesis, the distributions of the estimated treatment effects appear roughly centered at 0, and the p-curves appear to take on a roughly uniform distribution.

Figure SI.3: Distribution of (a) treatment effects and (b) p-values of tests on fixed charac-
teristics across Mumbai's 24 administrative wards.

(a) Estimated treatment effects

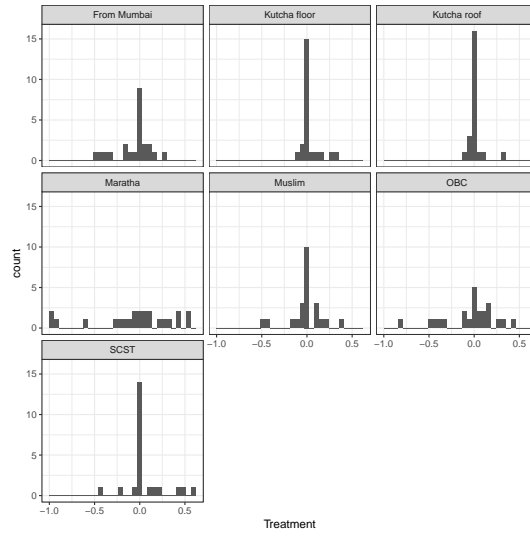

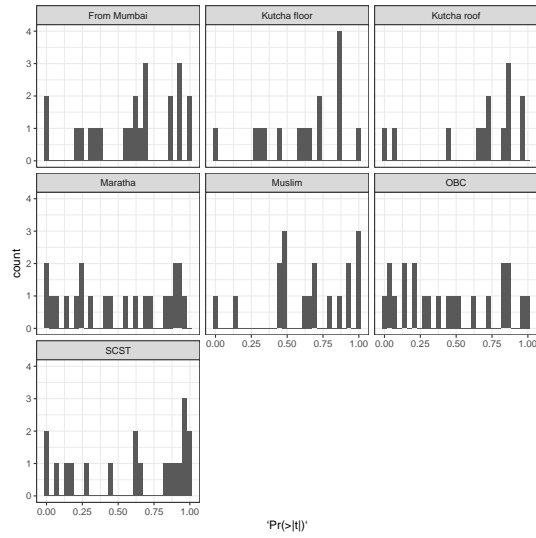

(b) Estimated p-values

Table SI.9: Treatment effects on age by cohort.

Cohort	Control	Treatment	sd
$Turned_6$	9.454	-0.067	0.227
$Turned_{16}$	19.228	-0.107	0.340
$Turned_{18}$	21.175	-0.242	0.308
$Turned_{21}$	23.638	-0.099	0.218
Older	44.859	0.259	0.505

The "Control" column presents means for winning households. The "Treatment" column presents the difference between winning and non-winning households estimated through an OLS regression of each variable on indicators for winning the lottery. All models include standard errors clustered at the household level and the treatment indicator interacted with mean-centered block dummies. "$Turned_X$" is an indicator for membership in the cohort of individuals that completed X years of age in between the lottery and being surveyed, using $age_{\bar{l}}$, or each individual's oldest possible age. "Older" is an indicator for being in the cohort of individuals older than 21 at the time of the lottery.

F   Results using alternative age indicator

As the survey did not collect information on dates of birth or age at the time of the lottery but age at the time of the survey only, this coding was done using the following logic: For applicants to the 2012 and 2014 lotteries, surveys were conducted 5 years and some fraction of a year or 3 years and some fraction of a year after the lotteries, respectively. Suppose an individual was age_s on the date of the survey in 2017, s, and participated in the 2012 lottery. On date s in 2012, she would be exactly $age_s - 5$. If her birthday had occurred between the lottery and the survey, she would have have been $age_s - 6$ at the time of the lottery. If her birthday had occurred before the lottery that year, she would be $age_s - 5$ at the time of the lottery. This same logic holds for participants of the 2014 lottery, except the lottery age could be either $age_s - 3$ or $age_s - 4$. In this way, one can code two possible ages age_l for individuals at the time of the lottery using age_s, which we will call $age_{\bar{l}}$ and $age_{\underline{l}}$ to correspond to the older and younger possible options. Individuals are further coded to have turned X years old ($Turned_X$) after the lottery if age_s is greater than or equal to X and age_l is less than X. Given the two possible values for age_l, there are also two values for $Turned_X$. For simplicity, tables in the text present results assuming all individuals were $age_{\bar{l}}$ at the time of the lottery. Results using $age_{\underline{l}}$ are similar and presented in here.

Main outcomes (rows A–B); *Outcomes related to proposed mechanisms* (rows C–H)

[1] Variable definitions for survey-based outcomes available in Table SI.1 .   [2] Intercept in an OLS regression of outcome on treatment indicator, covariates on which balance was tested, and an interaction with the treatment indicator and centered stratum-level indicator for randomization groups.   [3] Coefficient on treatment indicator in the same OLS regression as reported in note 2.   [4] HC2 errors. Errors clustered at the household level for individual results.   [5] Benjamini-Hochberg adjusted p-values.   [6] N=3,170   [7] N=834   [8] Data from 2011 Indian Census.   [9] Postal-code level data for 2017 were provided by Department of School Education and Literacy, Ministry of Human Resource Development, Government of India.
